Technical note N°2/2018

Position of the mast foot

The position of the mast foot is defined as the distance between the backside of the bow (at the level of the bottom bolt of the crash-bow, 2cm above) up to the front side of the mast (just above the mast foot). That measure is done with sufficient tension in the runners.

The minimum distance from front face of the mast at mast foot top level to a target at bow 20mm above the bottom bolt of the crash-bow is **5.119mm**.

Should a team decide to do a modification on the boat, the work shall be documented. A report with picture shall be sent to the Class measurer. The new mast foot position shall be measured and recorded.
